

Comprehensive Dreamweaver Project Directions:

For this project, you will create a website from scratch and host it live on the internet.

A new wellness clinic in the area has requested a site with the following pages.

- **Homepage(index.html)**
- **Services(services.html)**
- **Our Team(team.html)**
- **Contact Us(contact.html)**

You will complete the following tasks to show your mastery of web design skills using Adobe Dreamweaver. Remember to read the directions carefully, so you do not miss any steps. Read through the requirements one last time before submitting your files.

Read the following directions thoroughly before designing the layouts of the requested pages.

REQUIREMENTS

1. General

- Your **colors and layouts should be consistent** so each page feels like it's part of a cohesive website.
- Remember to **consider the audience** when making design decisions. You can take a look at similar sites for layout/content ideas.
- Feel free to use [lorem ipsum](https://www.lipsum.com/) to fill areas of text. <https://www.lipsum.com/>
- Use a **consistent navigation menu** across all pages.
- Include a **consistent footer** across all pages

2. Homepage

- The priority of the site is to:
 - Get people in contact with the clinic.
 - Provide information to convince people to get in contact with the clinic
- Make sure these are both "[calls to action](#)" on the homepage "[above the fold](#)". Google it. =)

3. Services

- Include the following services with an image and description (you can use lorem ipsum for the description.)
 - One-On-One Therapy**
 - Couples Counseling**
 - Group Therapy**
 - Addiction**
 - Trauma Survivors**
 - Meditation Classes**

4. Our Team

- Include 4 team members with images and bios

5. Contact Us

- Include a contact form

DIRECTIONS

1. **Plan your layouts** by creating a low-fidelity [wireframe](#) for each page using Adobe Photoshop, [Draw.io](#) or similar program.
2. **Collect some royalty free images** using a site like <https://unsplash.com/>
3. **Once you have gathered all the necessary resources** and have a plan, you may start building the pages.
4. **Use the bootstrap template for each page** so your site will adjust for mobile automatically. Remember to check the mobile view as you make changes. You don't want to build the entire page and find out it doesn't work well on a mobile phone.
5. **To host your website** we will use replit.com
6. First you will need to **create a free account**.
7. **Follow the video guide to complete the following steps.**
 - a. Create a new HTML CSS replit and name it.
 - b. Open the folder containing your website files.
 - c. Select the files from your folder and drag them to the files area in replit.
 - d. Click the run button in replit to preview your site.
 - e. Click the "open in new tab" button to see your site.
 - f. Your site is now live on the internet!
8. **Review the requirements** one final time and proofread everything again before submitting your project. Be sure ALL links work and all images show up.
9. **Submit the URL** for your site through Canvas.
AND submit a .zip folder with all of your website pages, images, css, etc. inside to canvas (just like we have done for all other class projects this semester).
